Northbridge Public Library asks the university review panel to compare proposals for improving access across three neighbourhood branches. Each candidate should submit an independent recommendation grounded in the fictional facts here. The annual budget is fixed, the buildings remain publicly owned, and the council must publish its reasoning before the next funding meeting. Discuss the proposal assigned to you, identify who benefits, describe an implementation obstacle, and name an observation that could change your decision. Do not invent survey findings or treat an illustrative calculation as measured evidence. Keep any quotations separate from your own analysis and explain uncertainty in language. The panel welcomes disagreement when the argument follows from stated assumptions. Your response should be understandable to residents without specialist training. Include a practical first step, a responsible team, and a review date. This shared institutional prompt is provided for context and should not be assessed as original analysis.

Wheelchair access depends on the route between the pavement and the reading desk. A ramp is insufficient when a heavy inner door cannot be opened without assistance. Invite an access group to inspect that route with the facilities team and rank the barriers by the effort they impose. Start with the door closer and a clear turning space near the entrance. Repeat the visit after installation rather than accepting a supplier photograph as proof. A lift upgrade should wait for an engineering survey of the upper floor.
